
NORTH KOREA'S NEW 'TACTICAL' WEAPON TEST HIGHLIGHTS MILITARY MODERNIZATION

-

19.11.2018

Japan Times (19 November 2018)

North Korea's claim last week that it had tested an unidentified ultramodern tactical weapon highlighted its desire to upgrade its conventional arms and reassure its military even as talks are underway to end its nuclear program, analysts said.

North Korean leader Kim Jong Un witnessed the test of a newly developed tactical weapon that could serve as a steel wall, state media reported Friday, without giving details of the weapon.

It was Kim's first observation of a weapons test this year and could complicate already stalled nuclear talks with the United States, although Washington and Seoul downplayed the development in an apparent effort not to derail negotiations.

Experts say the test was part of Kim's initiative to shift the mainstay of the conventional military power from a nearly 1.3 million-strong army to high-tech weapons.

This is sort of like the North Korean version of military reform, said Choi Kang, vice president of the Asan Institute for Policy Studies in Seoul.

If we have to find an underlying message to the outside world, it's Don't underestimate us, we are modernizing too.

New advanced weapons might be even more crucial if the country abandons at least some of its nuclear arsenal.

Although heavily-sanctioned, Pyongyang is easily outspent in defense funding by Seoul and Washington, the North's forward-deployed troops, guns and multiple-launch artillery rocket systems (MLRS) pose a significant threat to the allies.

The North Korean military has nearly 5,500 MLRS, 4,300 tanks, 2,500 armored vehicles, 810 fighter jets, 430 combatant vessels and 70 submarines, according to a 2016 assessment by the South's Defense Ministry.

The Center for Strategic and International Studies said last week it has identified at least 13 undeclared missile bases inside North Korea.

The Washington-based think tank has also said Pyongyang has been developing hovercraft units for its 200,000-strong special forces as part of the military modernization drive.

Kim has been pushing to modernize production lines at munitions factories and replace aging

weapons and technology since he took power in late 2011.

The defense industry should develop and manufacture powerful strategic weapons and military hardware of our style, perfect its Juche-oriented production structure and modernize its production lines on the basis of cutting-edge science and technology, he said in his 2018 New Year speech, referring to the long-held principle of self-reliance.

The two Koreas agreed during their September summit in Pyongyang to significantly reduce military tensions along the border, and the North has begun deactivating artillery deployed along the skirmish-prone western shore, Seoul's Defense Ministry said.

But the pact did not include any removal of MLRS from forward-deployed areas, where some long-range guns and rocket launchers can still reach Seoul.

South Korea's Yonhap news agency reported the newly tested weapon was a new model of MLRS, citing an unnamed military source familiar with intelligence. Other experts suggested it might be a new, short-range missile.

Kim Dong-yub, a military expert at Kyungnam University's Institute of Far Eastern Studies in Seoul, said by touting a modernized weapon, Kim could seek to reassure hard-line military generals and the public in North Korea who may be worried about a nuclear-free future.

With Kim having publicly declared the economy a new priority and saying the North would denuclearize, many in the military who saw a decline in interest and support could be doubtful and anxious because he has not secured significant concessions like an end-of-war declaration, Kim, the professor said.

It could have been necessary for him to consolidate the nation even though such a field guidance would give a negative signal to the outside.
